"Mechanism of Action of Disinfectants on Pathogenic Microorganisms"

Sofia, Veterinara Sbirka, Vol 63, No 5/6, 1966, pp 11-14

Abstract: In experiments in which the action of a number of disinfectants on Bac. anthracis, Brucella suis, Nycob. tuberculosis, and BCG was studied, a correlation between antibacterial action of the disinfectants and their suppression of dehydrogenase activity of the microorganisms was established. The parallelism between the inhibition of dehydrogenase activity and bactericidal action was not complete - it varied with the nature of the disinfectant. With decreasing temperatures in the 0-37.5° range, the dehydrogenase activity decreased. The concentration of disinfectant required to suppress the dehydrogenase activity increased with decreasing temperatures in this range. In experiments with Bac. anthracis, there was complete correspondence between the bactericidal effect and inhibition of amylase activity for phenol only; all other disinfectants exerted only

"Escherichia coli Septicemia in Poultry."

Sofia, Veterinarna Shirka, Vol 59, No 10: pp 7-9.

Abstract: Escherichia coli infection in several chicken farms: serotypes O₁, O₂, and O₇₈; severe clinical and histopathologic course: enteric, respiratory symptoms; also pericardial and perihaptic lesions, mortality especially high in newly-hatched chicks - up to 40%. Treatment includes general sanitation measures, often neglected while rapidly expanding poultry raising in Bulgaria during the course of the last few years; vitamin-mineral - fortified feed, antibiotics or sulfaguanidine if former not available. Epidemiologic data and experimental study in 150 chicks confirmed diagnosis. A dozen Western and a few Bulgarian authors are cited without references.

SOV/79-29-2-68/71

TITLE: A New Empirical Equation for the Radii of Ions With the Electronic Structure of an Inert Gas (Novoye empiricheskoye uravneniye dlya radiusov ionov s elektronnoy strukturoy blagorodnogo gaza)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 2, pp 689-691 (USSR)

ABSTRACT: The size of the effective ion radii depends on the type of bond in the crystal, on the coordination number of the crystalline structure and on the chemical nature of the ions, surrounding the ion to be investigated. With one and the same type of bond and the same coordination number, the dimensions of the ion radii are rather constant and do not depend on the other components of the bond. As an approximation the distance between the ions in crystals is equal to the sum of the radii ($d = r_k + r_a$). Besides the semiempirical calculation methods (Refs 1-4) also full empirical equations were set up, connecting the ion radii to any physico-chemical constant, most frequently to the order number of the element (Refs 5-8). The ion radius according to Kapustinakiy (Ref 9) finally, appears as the function of the total sum of electrons (m) in the ion and of its valency (γ).

Card 1/3

SOV/79-29-2-68/71

A New Empirical Equation for the Radii of the Ions With the Electronic Structure of an Inert Gas

The suggested formula $r = \frac{1 \text{ gm}}{\eta^{1/3}}$ refers to cations only with 8 elec-

trons in the external layer. In the present paper the author wants to stress the fact that Kapustinskiy's equation is only a partial case of the more marked general empirical equation $r = a + k \lg Z$, where k denotes the constant, a the function of the ion valency, Z the order number of the element. The coefficient $k \cdot 1$ (more precisely 0.95) may be assumed for the cations. Quantity a is the function of the cation valency. The same equation may be considered as being $r = k(a' + \lg Z)$, where $a' = \frac{a}{k}$. This new constant simply depends on the valency of the cation, i.e. $a' = \frac{1 \cdot n}{4}$, where n denotes the ion valency.

Regarding the anions, k is no constant value but the function of the anion valency. The values of the radii of the individual ions calculated by means of the above equation are shown in the table and are compared to the empirical radii according to Goldschmidt, V. (Ref 1), Pauling, P. (Ref 3) and Kapustinskiy (Ref 9). Apart from the elements of the fourth period (with 18 electrons) the results obtained for the other elements are in good agreement with

TITLE:

Free Oscillations in a Coil

PERIODICAL:

Elektrichestvo, 1960, Nr 3, pp 55 - 59 (USSR)

ABSTRACT:

A survey of the available publications is given here first. The papers by K. W. Wagner (Ref 1), L. Blume and A. Boyajian (Ref 2), L. V. Byuley (Ref 3), V. A. Karasev (Ref 4), B. Heller, I. Hlavka, and A. Veverka (Ref 5), I. Pirenne (Ref 6), B. Heller and A. Veverka (Ref 7), and V. A. Karasev and A. V. Sklyanin (Ref 8) are mentioned. The magnetic field of the coil and the free oscillations in coils with earthed neutral conductor are investigated here. The formula for the computation of the frequency of free oscillations in a coil with a steel core is derived. The computation of the frequency of natural oscillations in a coil with earthed neutral conductor and in a coil with insulated neutral conductor is then shown. The mutual induction between the coil windings is computed analytically, Maxwell's equations being applied. The distribution of

Card 1/2

03711

Free Oscillations in a Coil

S/105/60/000/03/010/023
B007/B008

the current along the length of the coil is taken into consideration for the computation of the magnetic field in the core window. The formula given here for the computation of the frequency of free oscillations in the coil changes over to the formula by L. Blume - A. Boyajian - L. V. Byuley in the case of high harmonics. There are 4 figures, 1 table, and 8 references, 3 of which are Soviet.

AUTHORS: Genov, L. Kh., Nesmeyanov, An. N., and Priselkov, Yu. A.

TITLE: Measurement of thallium vapor pressure with radioactive indicators

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 140, no. 1, 1961, 159 - 161

TEXT: The authors measured the vapor pressure of liquid and solid thallium in wide temperature intervals since the results published so far were conflicting. The authors used the methods of Knudsen and Langmuir with introduction of the radioactive isotope Tl^{204} and a special device described by them in Ref. 7: Yu. A. Priselkov, A. V. Tseplyayeva, K. I. Smirnov. Pribor dlya izmereniya davleniya nasyshchennogo para metodom effuzii (Apparatus for measuring the saturated vapor pressure by the effusion method), Izd. fil. VINITI, tema 39, No. II-58-95/6, 1958. The temperatures in the device were measured with a $^{54}Cr-Al$ thermocouple connected to a TMC-48 (PMS-48) potentiometer. The error in temperature measurement due to heat loss was neglected. The specific activity of the thallium used was 2mcu/g, which did not influence the results. Tl^{204}

Card 1/4

Measurement of thallium...

S/020/61/140/001/020/024
B127/B101

contained no radioactive impurities. The rate of evaporation was determined from the radioactivity of the condensed vapor leached out with nitric acid. The solution was neutralized with ammonia, heated up to 60 - 70°C, and quantitatively precipitated with $K_2Cr_2O_7$ as thallium chromate. The radioactivity of the dried filtrate was measured with an end-window counter. The vapor pressure P was determined from the equation $\log P = 17.14 G \sqrt{T/M}$ (1), where M is the molecular weight of vapor, and G is the effusion rate as determined from the equation: $G = g/\tau K\sigma$, where g is the quantity of evaporated substance; τ is the exposure; σ is the surface of the effusion orifice; and K is Clausing's factor. The results given in Table 1 were obtained from experiments (1-19) with different effusion orifices and by the method of evaporation with a free surface (experiments 20-29). The results agree with the equation $\log P = 8.0871 - 8899.4/T$ obtained by the method of least squares. It is assumed that the condensation coefficient of liquid and solid thallium is close to unity. This factor depends on the state of the gaseous phase, on the energy state of the surface, and on the presence of an oxide film on this surface. On the other hand, it is shown indirectly that thallium vapor

Card 2/4

Measurement of thallium...

S/020/61/140/001/020/024
B127/B101

is atomic. The mean evaporation heat of thallium between 519 and 924°K is 40.72 kcal/mole. The authors used L. V. Gurvich's equation $R \ln P = \Phi_g^* - \Phi_{kr}^* - \Delta H_0^0/T$ (ZhFKh, 34, 217 (1960)) to calculate ΔH_0^0 .

There are 1 figure, 1 table, and 12 references: 7 Soviet and 5 non-Soviet. The reference to English-language publication reads as follows: F. F. Collemann, A. Egerton, Phil. Trans., A 234, 177 (1934).

TITLE: The rate of evaporation of thallium selenide
(TlSe)

PERIODICAL: Moscow. Universitet. Vestnik. Seriya II,
Khimiya, no. 5, 1962; 34-35

TEXT: The above was measured between ~ 430 and 570°K , on
TlSe made by reacting equivalent amounts of Tl (containing
Tl²⁰⁴) and Se in a sealed quartz tube, at 400°C over 24 hours.
The vapor pressure P was measured on an apparatus described
earlier by the authors (Ref. 2: Dokl. AN SSSR, 140, No. 1, 159,
1961) determining the amount of condensate by the quantity of
Tl²⁰⁴ and calculating the rate of evaporation, P , and heat of
sublimation ΔH_T by methods described in the same, earlier

Card 1/2

The rate of...

S/189/62/000/005/002/006
D204/D307

work. It was assumed that the vapor consisted of an equivolar mixture of Tl_2Se and Tl_2Se_3 . The vapor pressure was determined by (1) the effusion method (effective surface of aperture = $7.82 \times 10^{-4} \text{ cm}^2$), and (2) the evaporation from an open surface (area = 1.68 cm^2). From the results, the relationships (1) $\log P = 9.9638 - \frac{7384.6}{T}$ ($\Delta H_T = 33.56 \text{ kcal/mol}$), and (2) $\log P = 11.3501 - \frac{8613.3}{T}$ ($\Delta H_T = 39.41 \text{ kcal/mol}$) were developed. The results are not in agreement with those of M. G. Shakhtakhtinskiy and A. A. Kuliyeu (Ref. 3: Fizika metallov i metallovedeniya, IX, No. 2, 202, 1960) and indicate that the coefficient of evaporation is not equal to unity. There is 1. table. ✓

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 12, 1966, pp 1215-1217

Abstract: [English article] The paper summarizes earlier findings and recent results concerning infestation of 1957 specimens of Coprophagous beetles with larvae of spirurates in pigs. A comprehensive statistical table lists 25 species of intermediate hosts. References: 4 Bulgarian, 3 Soviet, and 3 Western. (Manuscript received, 27 Jul 66.)

Kvazirivnovazheni mosty zminnoho strumu (Quasi-Balanced Alternating Current
Bridges) Kyiv, Vyd-vo AN URSR, 1960. 184 p. 1,000 copies printed.

Sponsoring Agency: Akademiya nauk Ukrayins'koyi RSR. Instytut mashynoznavstva
ta avtomatyky.

Ed.: V.P. Sihorskyi, Candidate of Technical Sciences; Ed. of Publishing House:
I.F. Shtul'man; Tech. Ed.: O.O. Kadashevych.

PURPOSE: This monograph is intended for engineers and scientific workers engaged
in the study of electrical measurements and automation. It may also be used
by students and aspirants in corresponding specialities.

Ukrainian
COVERAGE: This book deals with the problems of design and analysis of special
alternating-current bridge circuits (quasi-balanced), exceptionally simple in
their use and designed for measuring alternating current. The principle defini-
tions of measured parameters are described, and a brief review of existing
methods of measurements is given. General equations of the bridge circuit are
analyzed, and conditions are established for various independent measurements

Title : The Influence of the Mother-Bee on the Flight and
Hive Activity of Bees (Vliyaniye matki na letnuyu
i ul'yevuyu deyatel'nost' pchel)

Orig Pub: Pchelovodstvo, 1957, No 5, 8-12

Abstract: From tests carried out on 8 families (4 experimental
and 4 control ones), it was established that taking
out the mother-bee from the hive disturbs the flight
and hive activity of the bees. In the test families,
the intensity of the bee flights decreased by 77.4%;
the load of the honey ingluvies of the bee - by 62.5%;
the number of incoming bees with "pollen baskets" -
by 73.2%; the weight of the pollen basket brought

TITLE: Application of two-center functions in calculations of biatomic molecules

SOURCE: AN Lit SSR. Litovskiy fizicheskiy sbornik. v.1, no.1-2, 1961, 101-117

TOPIC TAGS: wave function, single-electron wave function, two-center wave function, Schroedinger equation, biatomic, molecule, ion, H, hydrogen

ABSTRACT: This theoretical paper deals with the two-center single-electron wave functions which have been obtained by others as the result of a solution of the Schroedinger equation for the positive ion of the Hydrogen molecule. The primary task of this paper is an application of the Bates functions (Bates, D. R., et al., Roy. Soc., Proc., v. A234, 1956, 207) to the calculation of biatomic molecules for the case when the wave function of the system is constructed in the form of determinants, consisting of said functions, on the premise that a single type of equivalent electrons exists. The effective charge is determined from the condition of minimum energy of the system. The general equation is obtained for the energy of a molecule in the form of a sum of integrals of the elliptical coordinates, λ ,

Card 1/3

L 18858-63

ACCESSION NR: AT3002108

which can be calculated by numerical integration; in a particular case, they are reduced to tabulated integrals. All ultimate equations appear in two forms: The first affords a possibility of employing Bates' tables, recomputed for suitable values of the effective charge, wherein the matrix element of the interaction operator of the electrons is determined by numerical integration. The second affords a possibility of reducing all integrals of the theory to the tabulated ones; the full employment of the Bates tables, of course, is thereby excluded. With further reference to the two possible methods for the calculation of biatomic molecules with identical nuclei by means of the two-center functions, it is noted that the first of them, that is, the method employing the tables of the parameters, the energy, and the coefficients of the Bates wave functions, conceives of the energy of a system rationally in the form of the sum of the energy of the electrons relative to the nucleus and the energy of interaction between the electrons. The first term of this sum can be calculated with the aid of Bates' tables as recomputed for suitable values of the effective charge (see above). The second term of the sum is found by numerical integration. Consequently, for the calculations undertaken, it is advisable to tabulate the integrals in terms of which the matrix elements of the interaction operator between equivalent and nonequivalent electrons can be expressed. The second method, in which the effective charge is varied for specified R and 2σ in integers, leads to the integrals tabulated by M. Kotani et al.,

Card 2/3

ACCESSION NR: AT3002108

Phys. Mat. Soc. Japan, Proc., v. 20, extra no.1, 1938. This variant eliminates the employment of the Bates tables for the parameters and for the energy. The maximum accuracy of this method does not exceed the accuracy of the graphs employed. The first variant can achieve almost any desired degree of accuracy. "The authors express their cordial gratitude to M. G. Veselov and M. I. Petrashen' for their attention and valuable advices proffered in the course of this work. The authors also thank A. P. Yutsis, N. D. Sokolov, and I. B. Levinson for comments and observations on the work." Orig. art. has 90 numbered formulas.

TITLE: The Separation of Iron and Copper Cations by Paper Chromatography in the Presence of Large Amounts of Carbohydrates
(Razdeleniye kationov zheleza i medi khromatografiyey na bumage v prisutstvii bol'shikh kolichestv uglevodov)

PERIODICAL: Zhurnal analiticheskoy khimii, 1958, Vol. 13, Nr 4, pp. 501-502 (USSR)

ABSTRACT: There almost exist no data in publications on the influence exerted by large amounts of organic substances on the chromatogram of organic compounds, however, this influence frequently becomes evident in the analysis of products of food industry. The authors of the present paper investigated the influence of the two carbohydrates saccharose and glucose on the chromatographic separation of the Fe^{3+} and Cu^{2+} ions. The behavior of these two cations in the chromatography in media containing no carbohydrates is known (Ref 3), as are the R_f values for Cu^{2+} and Fe^{3+} in various solvents. Glucose has a reducing effect (Ref 4), saccharose does not demonstrate this property. The separation of iron and copper was carried out in
